

Can we trust the training report?

A practical guide to the problem, the reviewer experience, and the contribution of EduWork DataBridge.

THE MONDAY-MORNING QUESTION

"Who completed cybersecurity training, passed, and received the credential?"

120

people in HRIS

366

learning events

120

assessment results

25

credential awards

PREPARED FOR

Nafiz Imtiaz

Pre-production reference build. The public case file is deterministic and synthetic; no company adoption or outcome is implied.

IT STARTS WITH AN ORDINARY REQUEST

Four exports. One answer due by noon.

HR has the employee roster. The learning platform has completion records. Scores arrive in a spreadsheet. Credential awards come from another system. None of those systems is necessarily wrong; they simply do not tell the story in the same language.

HRIS

Employee ID, department,
employment status

LMS

Assignment, completion,
course, LMS account

Assessment

Attempt, score, pass or
fail, event time

Credential

Award, issue date,
expiration date

WHERE TRUST BREAKS DOWN

A missing ID gets filled from memory. Two accounts that look alike get merged. A completion date that predates assignment is left alone because the report is late.

WHAT DATABRIDGE CHANGES

The project gives that reasoning a place to live. A source snapshot stays available. A bad row carries a reason. A likely identity match carries evidence. A published field keeps a route back to the rule and original source.

A HUMAN-FACING PROOF

Follow the answer, not the architecture diagram.

The reviewer desk turns the public fixture into a case file: source counts, planted exceptions, identity evidence, and a field-lineage path. The preview stays useful if the local API is offline and labels that state clearly.

BEFORE ANYONE PUBLISHES A NUMBER

keep the source, show the rule, and make uncertainty visible.

05 Evidence trail

A FIVE-STOP EVIDENCE PATH

Follow the answer, not the architecture diagram.

01 Collect

02 Check

03 Connect

04 Publish

05 Trace

STOP 01

Keep the original evidence

Read approved files without changing them. Save a checksum, source name, timestamp, and run ID so the starting point can be proved later.

The small fixture contains 43 deliberately planted problems. Pick a stop to see what a reviewer should be able to learn there.

Evidence here: Six source files · checksums in the public manifest

01 Collect Keep the original	02 Check Name the issue	03 Connect Review uncertainty	04 Publish Gate the output	05 Trace Explain the field
------------------------------------	-------------------------------	-------------------------------------	----------------------------------	----------------------------------

The identity decision shown in the desk is a reversible UI preview. Recorded review decisions still belong to the authenticated backend workflow.

Public examples use synthetic data only.

EduWork DataBridge field guide / 3

THE PUBLIC CASE FILE

Awkward records are the point of the demo.

The small fixture includes 43 planted problem occurrences across nine issue types. These are test conditions, not findings from a company.

24 Identity

Missing IDs, name variants, and duplicate LMS accounts stay visible for review.

8 Timing

Completions before assignment, late events, and an early credential are held for confirmation.

11 Data quality

Unknown status values, department conflicts, and formula-like text receive explicit handling.

A CONCRETE IDENTITY CASE

HRIS RECORD

THE CONTRIBUTION

DataBridge makes the reconciliation inspectable: source evidence, rule evidence, review evidence, and output evidence stay connected.

PROOF BEFORE PROMISE

What the build shows, and what it cannot yet show.

THIS BUILD DEMONSTRATES

- Repeatable processing of deterministic synthetic fixtures
- Visible validation, match, lineage, audit, and export evidence
- A bounded pattern that can be configured for an approved workflow

A REAL PILOT MUST ESTABLISH

- Partner-specific ownership, mappings, rules, and review capacity
- Production identity, infrastructure, security, privacy, and retention checks
- Measured preparation time, exception rate, reviewer burden, and process value

A GOOD FIRST PILOT

Choose one recurring report and one named data owner. Run DataBridge beside the current manual process. Compare the time spent, the disagreements found, the number of cases that need review, and whether a reviewer can trace a final field without calling the pipeline author.

RUN THE REFERENCE BUILD

```
uv sync --frozen --extra dev
npm --prefix apps/reviewer-ui ci
uv run alembic upgrade head && uv run python -m eduwork_databridge.seed
make api      # terminal 1      make ui      # terminal 2
```

The software prepares evidence. People remain responsible for consequential decisions.
